Endless Runner - Chat History

Software Engineering Lab 4 | 30 September 2026

Transcript of user and assistant messages, in conversation order. Includes progress updates and interrupted turns. Tool calls, internal instructions, and tool outputs are omitted. Export includes the request to create this PDF and updates issued before generation.

01 USER

Checkout the endless runner gamefolder in this dir. There are a few requirements listed in the Readme file. Go ahead and complete them. Polish the game nicely.

02 ASSISTANT

I'll inspect the endless runner folder and its README, complete the listed requirements, and polish the gameplay and presentation.

03 ASSISTANT

The README lists four tasks: reliable collisions, a game-over screen, replay with difficulty selection, and sound effects. The current game uses frame-based movement and an unlimited speed ramp. I'll add time-based physics, swept collision checks, a speed cap, and a polished neon theme with menus, particles, and pause controls.

04 USER

continue

05 ASSISTANT

I'll continue the implementation, then check collisions, replay, difficulty settings, and the game screens.

06 USER

continue

07 ASSISTANT

Pygame is installed. The interruption happened after the old files were removed, so I'm restoring them with the completed implementation now.

08 ASSISTANT

All four features are implemented, and six regression tests pass, covering collision tunneling, scoring, replay resets, difficulty caps, pause, physics, and sound generation. I'm checking the rendered screens and running longer simulations to confirm each difficulty remains playable at maximum speed.

09 ASSISTANT

Completed all four README tasks: reliable collisions, final-score screen, replay with difficulty selection, and sound effects.

Added a neon skyline, particles, polished menus, pause, and mute controls. Six tests pass; two-minute simulations passed on every difficulty.

Run inside `39_endless-runner`:

```powershell
python main.py
```

The coursework videos and shared chat link still need submission.

10 USER

okay so basically we have 2 problems. 1. The buildings in the background seem to be rubberbanding 2. The particles are a bit messed up, there are stray particles when the character is at the top during the jump.

11 ASSISTANT

I'll check the skyline scrolling and particle spawning, then fix both issues.

12 ASSISTANT

The buildings snap because their positions wrap every 100 pixels, but their heights remain tied to screen slots. I'll give each building a stable world index.

The stray particles come from long-lived jump dust and score bursts spawned above the airborne player. I'll shorten the dust effect and move scoring feedback to the score display.

13 ASSISTANT

Fixed both:

- Buildings keep their identity while scrolling, eliminating the wraparound snap.
- Jump dust clears before the apex. Scoring now flashes the score display instead of spawning stray airborne particles.

All 8 tests pass. Restart the game to load the changes.

14 USER

Now go ahead and Export this chat history as a pdf into this folder

15 ASSISTANT

I'll export the user and assistant messages from this conversation into a PDF in the current folder.

16 ASSISTANT

I'm using the PDF skill to format the transcript and verify its page layout.
